

Full Insurance Lifecycle Business Test Cases

3 end-to-end business flows | Technical implementation intentionally excluded

Business scope: Small-business commercial Property & Casualty insurance

PURPOSE

Validate that IntelliSure behaves as an insurance lifecycle platform rather than a collection of CRUD screens. Each test case verifies a business state transition, authority boundary, evidence requirement, or operational outcome.

1. Test Strategy

- These tests use the business vocabulary and lifecycle defined in the IntelliSure Insurance Lifecycle Business Blueprint and Microservice Business Definitions.
- The three flows are intentionally different: a clean new-business cycle, a mid-term-loss/recovery cycle, and an exception/referral/non-renewal cycle.
- AI/Analytics is excluded from pass/fail dependency. Where analytics could exist, the human business authority remains the decision-maker.
- A test passes only when the stated business outcome occurs and the responsible role remains the authorized owner of the decision.
- Exact regulatory timing, cancellation rules, payment rails and product wording vary by jurisdiction and product; these are IntelliSure target business behaviors, not universal legal rules.

2. Lifecycle Model Under Test

Stage	Business meaning	Primary owner
0 Need / prospect	Business recognizes an insurance need.	Policyholder
1 Customer / business profile	Who is the party and what business does it represent?	Customer & Party
2 Coverage need / application	Desired protection, effective date, limits, deductibles and insurance need are captured.	Policyholder / Quote & Policy
3 Submission / intake	Completed information is submitted to the insurer.	Quote & Policy / Workflow
4 Triage / appetite	Completeness, eligibility, routing and appetite are checked.	Workflow / Risk & Underwriting
5 Underwriting / risk	Risk, hazards, controls, loss history and required conditions are evaluated.	Risk & Underwriting

INTELLISURE | BUSINESS QA BLUEPRINT

Stage	Business meaning	Primary owner
6 Risk engineering	Specialist inspection/findings/recommendations where warranted.	Risk Engineer
7 Pricing / terms	Coverage structure, limits, deductibles, premium and conditions are determined.	Underwriter / Quote & Policy
8 Quote / terms offered	Insurer provides proposed terms with validity/requirements.	Quote & Policy
9 Customer acceptance	Customer accepts, requests changes, declines or lets terms expire.	Policyholder
10 Bind	Authorized coverage is bound after required conditions.	Authorized underwriting/business process
11 Issue / in-force	Formal policy documents are issued and coverage is active for its effective period.	Quote & Policy / Document & Audit
12-13 Service / loss prevention	Endorsements, exposure changes, audits and risk-improvement activities occur during term.	Quote & Policy / Risk & Underwriting
14-19 Loss to closure	Loss → FNOL → investigation → coverage → reserve/assessment → settlement/payment → recovery → closure.	Claims / Recovery / Vendor
20 Renewal / non-renewal	Current exposure, claims and risk controls are reassessed for the next term.	Risk & Underwriting / Quote & Policy

3. Standard Test Data Profiles

Profile	Business facts	Coverage need	Expected path
A - Low-complexity restaurant	40-seat restaurant; stable operations; one location; complete information; no material loss history.	Property/equipment, general liability, business income.	Triage → Underwriting → Quote → Accept → Bind → Issue → Renewal
B - Restaurant with covered fire loss	Profile A plus fire loss during policy term; property/equipment damage; temporary closure.	Existing policy with applicable property/business-income coverage.	FNOL → Investigation → Assessment → Reserve → Vendor/Recovery → Settlement/Payment → Closure → Renewal
C - Higher-complexity contractor	Construction/contracting operations; material exposure; incomplete initial submission; specialist risk review required.	Property/liability and requested operational coverage.	Needs info → Referral → Risk Engineering → Conditional terms / decline depending on decision → Non-renewal branch if risk later becomes unacceptable

FLOW 1 — Clean New-Business → In-Force → Renewal

BUSINESS OBJECTIVE

Demonstrate the complete happy-path lifecycle from a policyholder request through underwriting, quote, acceptance, bind, issue, servicing and renewal.

Item	Definition
Entry criteria	Active policyholder + complete business profile + no prior policy required + complete submission data.
Exit criteria	An in-force policy has completed the term transaction and a renewal decision/path exists for the next term.
Primary roles	Policyholder; Underwriter; Risk Engineer; Claims Adjuster/Manager; Vendor Manager; Service Provider/Contractor; System Administrator as applicable
Services traversed	Customer & Party; Quote & Policy; Risk & Underwriting; Claims; Vendor & Partner; Recovery & Business Continuity; Workflow & Notification; Document & Audit; Analytics optional and non-authoritative

Business Flow

Step	Business event / action	Expected state / outcome	Primary owner
1	Register + business profile	ACTIVE policyholder with a canonical customer/business profile.	Customer & Party
2	Start draft insurance request	DRAFT submission contains insurance need, business facts and requested coverages.	Policyholder
3	Complete + submit	Submission is SUBMITTED and becomes eligible for intake/triage.	Policyholder / Workflow
4	Triage	Completeness/appetite checks pass; underwriting work is created.	Workflow / Risk & Underwriting
5	Underwriter assignment	Eligible underwriter receives a task based on configured work rules; assignment is recorded.	Workflow
6	Risk assessment	Risk facts, hazards, controls, loss history and evidence are evaluated.	Risk & Underwriting
7	Offer terms	QUOTE contains insurer terms, limits, deductibles, premium, validity and any subjectivities.	Underwriter / Quote & Policy
8	Customer accepts	Customer accepts the offered terms while quote is valid.	Policyholder
9	Bind + issue	Coverage is BOUND, then formal policy is issued/IN_FORCE for the effective period.	Authorized insurer process / Quote & Policy
10	In-force service	Policy remains authoritative; ordinary servicing can occur without rewriting history.	Quote & Policy
11	Renewal	Current exposures, loss experience and changes are evaluated for next term.	Underwriter / Quote & Policy

Test Cases

TC ID	Lifecycle stage	Role	Business test / action	Expected business outcome	Priority
F1-T01	Registration	Policyholder	Create a new policyholder account and complete the small-business profile.	Account becomes ACTIVE and the business has a canonical customer/party identity used downstream.	High
F1-T02	Authorization	Customer & Party / Admin	Attempt employee-role self-registration instead of administrator creation.	Employee role creation is rejected; internal roles are created/activated through the authorized administrative path.	High
F1-T03	Draft request	Policyholder	Create a quote request with business facts, desired coverage and insurance-need narrative.	A DRAFT request exists and remains editable.	High
F1-T04	Draft validation	Policyholder	Submit with missing required business/exposure information.	Submission is not accepted as complete; missing information is identified rather than silently routed for underwriting.	High
F1-T05	Submission	Policyholder	Submit a complete request.	Quote/submission moves to SUBMITTED; workflow starts intake processing.	Critical
F1-T06	Triage	Workflow / Underwriting	Run completeness, eligibility and appetite screening on the clean	Submission clears triage and is eligible for underwriting review.	Critical

INTELLISURE | BUSINESS QA BLUEPRINT

TC ID	Lifecycle stage	Role	Business test / action	Expected business outcome	Priority
			restaurant profile.		
F1-T07	Assignment	Workflow	Create underwriting work for the submitted case.	Exactly one current accountable underwriting task is created for the appropriate underwriter; assignment history is traceable.	Critical
F1-T08	Risk assessment	Underwriter / Risk Engineer	Review operations, location, fire protection, equipment, controls, loss history and supporting documents.	Risk assessment contains findings and recommendations; risk evidence is separate from the policy contract.	Critical
F1-T09	Subjectivity	Underwriter	Identify a required condition before binding, e.g., install/verify a control.	A subjectivity is recorded with an accountable task and is not silently treated as satisfied.	High
F1-T10	Pricing / terms	Underwriter	Set acceptable coverage structure, limits, deductibles, premium and quote validity.	A QUOTED offer contains explicit proposed terms and expiry; fixed-demo premium logic is not treated as authoritative business pricing.	Critical
F1-T11	Quote presentation	Policyholder	Open the quoted offer before expiry.	Customer can see the proposed terms and any outstanding requirements.	High
F1-T12	Customer rejection	Policyholder	Decline the quoted terms.	Quote records a controlled decline/withdrawal outcome; it cannot proceed to bind.	High
F1-T13	Quote expiry	Policyholder	Allow quote validity to end without acceptance.	Quote becomes EXPIRED and cannot be bound under the expired offer.	High
F1-T14	Acceptance	Policyholder	Accept a valid quote with all required subjectivities satisfied.	Customer acceptance is recorded and the transaction becomes bind-ready.	Critical
F1-T15	Bind control	Authorized insurer process	Attempt to bind while a mandatory subjectivity is outstanding.	Bind is blocked until the required condition is satisfied or formally dispositioned according to configured authority.	Critical
F1-T16	Bind	Authorized insurer process	Bind the accepted, condition-satisfied transaction.	Policy reaches BOUND with the contractual terms captured; bind is distinct from issuance.	Critical
F1-T17	Issue	Quote & Policy / Document	Issue formal policy documents for the bound transaction.	Policy becomes the authoritative in-force contract with policy number, effective dates, coverages, limits, deductibles and premium; issue evidence is retained.	Critical
F1-T18	Policy servicing	Policyholder / Quote & Policy	Request a non-material policy update during the term.	A controlled servicing transaction/endorsement is created; original policy history remains preserved.	High
F1-T19	Material change referral	Policyholder / Underwriter	Request a material exposure change, such as adding a second location.	Change is treated as a policy transaction and can trigger underwriting/risk review rather than silently changing the existing contract.	Critical
F1-T20	Renewal	Underwriter / Policyholder	Start renewal using current exposure and any term claims/changes.	Renewal is a distinct transaction with current information; outcome can be renewed, changed, referred or non-renewed.	Critical

FLOW 2 — In-Force Policy → Loss → Claim → Recovery → Settlement → Renewal

BUSINESS OBJECTIVE

Demonstrate the full post-loss lifecycle, including FNOL, coverage, investigation, reserve, vendor work, business recovery, settlement/payment, recovery and renewal.

Item	Definition
Entry criteria	An active policy exists with a loss occurring during the policy period; the loss has potential covered impact.
Exit criteria	Claim is properly closed after required claim actions; recovery work is complete or governed; renewal evaluates the updated risk.
Primary roles	Policyholder; Underwriter; Risk Engineer; Claims Adjuster/Manager; Vendor Manager; Service Provider/Contractor; System Administrator as applicable
Services traversed	Customer & Party; Quote & Policy; Risk & Underwriting; Claims; Vendor & Partner; Recovery & Business Continuity; Workflow & Notification; Document & Audit; Analytics optional and non-authoritative

Business Flow

Step	Business event / action	Expected state / outcome	Primary owner
1	Policy already in force	A valid policy exists with relevant property/business-income coverage.	Quote & Policy
2	Loss occurs	Real-world loss event affects insured operations/property.	Policyholder
3	FNOL	Loss date, location, narrative, estimate, immediate actions and evidence are captured.	Claims
4	Coverage verification	Policy is checked for in-force status and applicable coverage/terms.	Claims
5	Investigation	Cause, damage, liability, evidence and recovery opportunities are investigated.	Claims Adjuster
6	Reserve + assessment	Total loss, covered loss and expected payment are distinguished; reserve evolves.	Claims
7	Repair/vendor	Eligible service provider is matched and assigned where required.	Vendor & Partner / Workflow
8	Business recovery	Continuity actions, repair milestones and reopening plan are tracked.	Recovery & Business Continuity
9	Settlement + payment	Authorized settlement is determined; payment is separately tracked.	Claims Manager / Claims
10	Salvage/subrogation	Potential recovery from damaged property or responsible third party is pursued where applicable.	Claims
11	Closure + renewal	Claim closes when required work/evidence is complete; renewal later uses updated loss/exposure history.	Claims / Quote & Policy / Underwriting

Test Cases

TC ID	Lifecycle stage	Role	Business test / action	Expected business outcome	Priority
F2-T01	Loss event	Policyholder	Report a fire affecting insured property during the active policy period.	Loss becomes a candidate claim event; customer receives immediate next-step guidance to protect property and preserve evidence.	Critical
F2-T02	FNOL	Claims Adjuster	Open FNOL with loss date, location, policy, narrative, initial estimate and evidence.	A claim case is created with traceable FNOL information; FNOL is distinguishable from the ongoing claim lifecycle.	Critical
F2-T03	FNOL validation	Claims	Attempt to report a future-dated loss.	FNOL is rejected or corrected because loss date must be plausible and not future-dated.	High
F2-T04	Policy verification	Claims	Validate the policy was in force on the loss date and inspect relevant coverage.	Claims uses authoritative policy/coverage information from Quote & Policy rather than maintaining a competing policy master.	Critical
F2-T05	Evidence request	Claims	Request photos, inventory, proof of loss, repair bids and relevant business records.	Claim enters an evidence-driven handling path and outstanding documents are visible as work.	High
F2-T06	Investigation	Claims Adjuster	Investigate cause, circumstances, ownership/interest, damage and potential third-party responsibility.	Investigation findings are recorded; potential recovery paths are identified.	Critical
F2-T07	Coverage decision	Claims Adjuster / Manager	Determine whether the loss is covered, partially covered or denied under policy terms.	An explicit coverage decision and rationale exist, separate from generic claim status.	Critical
F2-T08	Exclusions / deductible	Claims Adjuster	Apply applicable exclusion, deductible, limit or sublimit during claim evaluation.	Covered loss and payable amount reflect policy terms; total physical loss is not automatically equal to payout.	Critical
F2-T09	Reserve	Claims Adjuster	Set an initial expected payment amount and update it as facts evolve.	Reserve evolves separately from settlement/approved amount and remains auditable.	Critical
F2-T10	Assessment	Claims Adjuster	Record detailed damage/financial assessment.	Claim assessment distinguishes total assessed loss from covered loss and supports settlement calculation.	Critical
F2-T11	Vendor eligibility	Vendor Manager	Attempt assignment to an unverified/inactive contractor.	Assignment is blocked or rerouted; only eligible providers can receive operational work.	Critical
F2-T12	Vendor assignment	Vendor Manager	Assign an eligible repair contractor to restore damaged equipment/property.	A vendor assignment exists with service scope, responsible provider and operational status.	High
F2-T13	Vendor decline	Service Provider	Contractor declines the assigned job.	Job returns to controlled reassignment/escalation rather than becoming lost.	High
F2-T14	Recovery case	Workflow / Recovery	Create a business continuity case for temporary location, equipment	Recovery case contains operational objectives and milestones; it	Critical

INTELLISURE | BUSINESS QA BLUEPRINT

TC ID	Lifecycle stage	Role	Business test / action	Expected business outcome	Priority
			and reopening.	does not imply coverage entitlement by itself.	
F2-T15	Recovery progress	Service Provider / Recovery	Update repair/reopening milestones with completion evidence.	Recovery progress is visible and evidence-backed; overdue milestones can trigger workflow escalation.	High
F2-T16	Settlement	Claims Manager	Approve a settlement after investigation and assessment.	Claim records an authorized settlement outcome distinct from the reserve and payment transaction.	Critical
F2-T17	Payment	Claims	Record payment issued against the approved settlement.	Payment status is separately represented; approved settlement is not incorrectly treated as payment completion.	Critical
F2-T18	Salvage / subrogation	Claims	Identify damaged equipment with recoverable value and a third party potentially responsible for the loss.	Salvage/subrogation work is opened and tracked separately from the insured payment.	High
F2-T19	Closure gate	Claims Manager	Attempt to close claim while mandatory evidence/payment/recovery actions remain incomplete.	Closure is blocked or flagged until required actions are complete or formally waived.	Critical
F2-T20	Renewal after claim	Underwriter	Begin renewal after a significant claim and updated business exposure.	Renewal uses current loss history, operations and risk controls; the prior policy is not simply copied forward.	Critical

FLOW 3 — Exception / Referral → Conditional Acceptance → Material Change → Non-Renewal

BUSINESS OBJECTIVE

Demonstrate realistic insurance exceptions: missing information, referral, specialist risk engineering, subjectivities, material policy change, reassessment and non-renewal.

Item	Definition
Entry criteria	Complex or incomplete submission requiring human intervention and potentially specialist risk engineering.
Exit criteria	The transaction is either correctly issued with conditions or correctly ends through a controlled non-renewal/decline path with evidence.
Primary roles	Policyholder; Underwriter; Risk Engineer; Claims Adjuster/Manager; Vendor Manager; Service Provider/Contractor; System Administrator as applicable
Services traversed	Customer & Party; Quote & Policy; Risk & Underwriting; Claims; Vendor & Partner; Recovery & Business Continuity; Workflow & Notification; Document & Audit; Analytics optional and non-authoritative

Business Flow

Step	Business event / action	Expected state / outcome	Primary owner
1	Complex/incomplete submission	Submission has material missing information or complexity.	Policyholder / Workflow
2	Needs information	Customer/document tasks are created with a clear owner and due date.	Workflow
3	Referral	Risk requires specialist/manual underwriting authority.	Risk & Underwriting
4	Risk engineering	Site/operations hazards and controls are assessed.	Risk Engineer
5	Conditional outcome	Underwriter may issue conditions/subjectivities or decline.	Underwriter
6	Policy in force if accepted	Conditions are satisfied and policy is bound/issued.	Quote & Policy
7	Material change / continuous risk	Exposure worsens or operations change materially.	Policyholder / Risk & Underwriting
8	Renewal reassessment	Current exposure and claims are reviewed.	Underwriter
9	Non-renewal / decline	Authorized business decision ends continuation for next term where rules support it.	Underwriter / Quote & Policy
10	Evidence + audit	Decision reasons, actor, timing and supporting evidence are preserved.	Document & Audit

Test Cases

TC ID	Lifecycle stage	Role	Business test / action	Expected business outcome	Priority
F3-T01	Submission	Policyholder	Submit a complex contractor profile with incomplete exposure information.	Case is accepted only as SUBMITTED/needs-processing; missing information prevents silent progression to a quote.	Critical
F3-T02	Needs information	Workflow	Create a customer information request for missing operations/exposure details.	Workflow creates an accountable task with due date and notification; the task is not confused with the underwriting decision itself.	Critical
F3-T03	Customer response	Policyholder	Provide requested information and supporting documents before due date.	Submission returns to an eligible review path; prior request remains traceable.	High
F3-T04	Overdue escalation	Workflow	Allow an information task to pass its SLA without response.	Workflow escalates the task according to configured escalation rules.	High
F3-T05	Underwriting referral	Underwriter	Identify a risk that exceeds automated/standard authority or requires specialist attention.	Referral is explicitly recorded with reason/authority context; human underwriting authority remains accountable.	Critical
F3-T06	Risk engineering	Risk Engineer	Perform a specialist hazard/control assessment for the contractor operation.	Risk findings and recommendations are recorded with evidence and remain separate from the contractual policy record.	Critical
F3-T07	Mitigation requirement	Risk Engineer / Underwriter	Require corrective action before binding, e.g., a specified safety/control improvement.	Subjectivity/condition is linked to the underwriting outcome and remains outstanding until verified.	Critical
F3-T08	Conditional quote	Underwriter	Offer terms subject to required corrective actions.	Quote is QUOTED with explicit conditions, expiry and terms; conditions are visible to the customer.	Critical
F3-T09	Condition not satisfied	Workflow / Underwriter	Attempt to proceed to bind without verified corrective action.	Bind path is blocked or referred to authorized exception handling.	Critical
F3-T10	Condition satisfied	Risk Engineer / Underwriter	Verify corrective action and record completion evidence.	Subjectivity becomes satisfied/closed and the transaction is eligible for next step.	Critical
F3-T11	Bind + issue	Authorized process	Bind and issue the accepted conditional transaction.	Coverage is BOUND and formal policy becomes IN_FORCE after required issuance/effective conditions.	Critical
F3-T12	Material exposure change	Policyholder	Add a materially different operation/location during the term.	Policy change becomes an endorsement/service transaction and triggers underwriting/risk review when material.	Critical
F3-T13	Risk deterioration	Risk Engineer	Find a significant unresolved hazard during follow-up.	New risk finding/recommendation is recorded; underwriting receives the condition/reassessment signal.	High
F3-T14	Evidence ownership	Document & Audit	Record the underwriting decision, reason, actor and supporting documents.	Evidence/audit records preserve who changed what, when and why; they do not replace the domain decision itself.	High
F3-T15	Renewal review	Underwriter	Review current operations, material changes, claims and unresolved risk findings for renewal.	Renewal starts as a fresh evaluation rather than date extension.	Critical
F3-T16	Renewal quote change	Underwriter	Offer materially different next-term terms after reassessment.	Renewal transaction contains proposed terms and a distinct customer decision path.	High
F3-T17	Customer declines renewal terms	Policyholder	Decline the renewal offer.	Renewal transaction records customer decision; current term remains governed by its existing lifecycle.	High
F3-T18	Non-renewal decision	Underwriter	Make an authorized non-renewal decision for the next term.	Non-renewal outcome and business reason are recorded; the system does not mislabel it as a mid-term cancellation.	Critical
F3-T19	Access after end of term	Policyholder	Attempt to use the expired/non-renewed policy as if it were active.	Business flow recognizes that the prior policy is no longer IN_FORCE; no new coverage is implied.	Critical
F3-T20	Audit completeness	System Administrator / Auditor	Review the end-to-end exception case history.	Key state changes, actors, reasons and supporting evidence are traceable across submission, underwriting, risk engineering and renewal outcomes.	High

4. Cross-Flow Business Invariants

ID	Business invariant	Pass condition
----	--------------------	----------------

INTELLISURE | BUSINESS QA BLUEPRINT

ID	Business invariant	Pass condition
BI-01	A Quote is not a Policy.	A submitted/quoted transaction must not be represented as an in-force insurance contract.
BI-02	Submission is richer than a price request.	Insurance need/narrative and structured business/exposure information are captured before underwriting.
BI-03	Acceptance is not the same as Bind.	Customer agreement and insurer/authorized binding remain distinct business moments even if orchestrated together.
BI-04	Bind is not the same as Issue.	Coverage can be bound before formal policy documents are issued.
BI-05	Policy is authoritative for coverage.	Claims uses Quote & Policy as the source of truth for policy terms and coverage.
BI-06	Workflow owns work, not domain truth.	Workflow can assign a task and escalate it but does not decide underwriting, claim coverage or policy status.
BI-07	Underwriter owns underwriting authority.	Risk scores, analytics and risk findings support the decision but do not silently replace authorized human business authority.
BI-08	Risk Engineer is not the Underwriter.	Risk Engineering assesses hazards/controls and recommends actions; underwriting decides acceptability/terms.
BI-09	Estimated loss is not payout.	Initial estimates can differ from assessed covered loss and final settlement/payment.
BI-10	Reserve is not settlement.	Reserve is the evolving expected payment liability; settlement is an authorized outcome.
BI-11	Settlement is not payment.	An approved settlement must have a separate payment lifecycle/state.
BI-12	Recovery is not coverage determination.	Recovery tracks operational restoration and continuity; Claims determines claim coverage/payment.
BI-13	Vendor eligibility precedes assignment.	Only verified/eligible providers should receive repair/service work.
BI-14	Endorsements preserve history.	Material policy changes are recorded as transactions rather than silently overwriting historical terms.
BI-15	Renewal is fresh evaluation.	Current exposure, claims, material changes and risk controls are used for the next-term decision.
BI-16	Closure has gates.	A claim should not close while required evidence, settlement/payment or governed recovery actions remain unresolved without formal disposition.
BI-17	Documents are evidence.	Document & Audit preserves evidence and history but does not become the owner of the business decision.
BI-18	Customer identity is centralized.	Customer/party identity is not duplicated as a competing master in downstream services.

5. Recommended Execution Order for Your Demo

Order	Flow	What to demonstrate	Must-pass business checkpoints
1	Flow 1	New business from registration to renewal setup.	SUBMITTED → triage → underwriter assigned → risk assessment → QUOTED → ACCEPTED → BOUND → IN_FORCE
2	Flow 2	Real loss and claim handling.	FNOL → coverage decision → investigation → reserve/assessment → vendor → recovery → settlement → payment → closure
3	Flow 3	Exception path.	NEEDS_INFORMATION → referral → risk engineering → subjectivity → conditional terms → bind/issue → material change → renewal/non-renewal

WHAT THIS SUITE IS TESTING

Not just whether endpoints return 200/201. It verifies that IntelliSure preserves the meaning of insurance work: who owns the decision, what the current business state means, what evidence is required, what can move to the next stage, and what must be blocked.

6. Source Basis

- IntelliSure Insurance Lifecycle Business Blueprint — September 2026 (project source).
- IntelliSure Microservice Business Definitions — September 2026 (project source).
- The underlying project entities, DTOs, endpoints, service-to-service communication and user-journey artifacts were treated as the current implementation baseline where relevant.

INTELLISURE | BUSINESS QA BLUEPRINT

- The terminology and lifecycle model intentionally follow the business vocabulary established in the project blueprint, including submission, triage, underwriting review, risk engineering, subjectivities, quote, acceptance, bind, issue, endorsements, FNOL, reserve, settlement, payment, recovery, salvage/subrogation and renewal.
